

AN ARTICLE BY VETERINARY
DERMATOLOGIST M.W. VROOM, DIPL. ECVD. (NL)

Practical experience with Remedy+ Yeastosol.

CASE. The atopic dog Fifi with recurrent malassezia infections in the armpits, despite the use of apoquel.

FIFI. Fifi is a happy crossbreed dachshund who has been suffering 9 years of severe itching. Especially in the summer. Food allergy is excluded through a self-cooking diet.

DIAGNOSIS. A serological test yielded high titers (between 2000-4000) for all grasses, weeds and dust mites tested. An immunotherapy has not led to success. The dog gets apoquel daily, previously treated with atopica. The malassezia pachydermatis continues to return and several times a year a treatment with ketaconazole is necessary to get rid of the yeasts. Anti-yeast shampoos do not help sufficiently enough. The ketaconazole is hepatotoxic, an alternative was very welcome.

RESULT. Fifi was treated with the Yeastosol every day for 14 days. After 14 days there is a huge improvement in the skin of the armpits and the groins. The skin is less thick and is has almost no folds. The dog has less itching.

Fifi has not experienced any irritation from the spray. The dog is now treated twice a week, or as needed with the spray at those areas. The apoquel remains necessary, but the dog does not need ketaconazole anymore.

THE PRODUCT. Yeastosol is a safe spray that kills the yeasts. Without the addition of antibiotics or hormones. Until now, the treatment against yeasts consisted of regular washing with an anti-yeast shampoo (washing, rinsing and drying) or an oral treatment with an anti-yeast medication. These azoles have the side effect of being hepatotoxic. (can cause liver damage).

PROFESSIONAL OPINION. An alternative was very welcome in this case. I find that the Remedy + Yeastosol is an easy and effective product. Even for difficult cases like this one.
